

**Abstract**

A Russian medical company based in Moscow is specialized in clinical laboratory diagnostics. The company is looking for technologies of early diagnosis of cancer based on biochemical analysis of patient's body fluids. The technology must be tested in medical centers for at least 2 years. The company seeks partners for technical cooperation and/or a license agreement.

Valid until: 22/11/2011

Description

Early diagnosis is crucial for successful treatment of cancer. At present, the tests detecting specific substances - tumor markers - are widely used. Unfortunately, the specificity and sensitivity of tumor markers are not sufficiently high. At the same time, new methods for diagnosis of cancer are being developed.

The Russian medical company specializing in the field of laboratory diagnostics is seeking new technologies for early diagnosis of cancer based on biochemical or other methods of analysis of patient's biological fluids. Results obtained with the new technology should surpass the ones received with today's conventional methods.

Technical Specifications / Specific technical requirements of the request

The technology must be based on several parameters.

It should be tested for minimum 2 years.
