

Seeking novel technologies and applications in the fields of telematics, communications and multimedia for use in the government domain

(10 IL 80EP 3JUV)

Abstract

An Israeli systems integrator seeks novel technologies and applications in the fields of telematics, communication and multimedia for use in applications relevant to government entities. The applications should be based on novel technologies and should be able to successfully demonstrate significant reduction in operations costs or increase in service to the public. Technology providers or integrators are sought for technical cooperation or joint ventures

- Operations specific to other government entities

Valid until: 30/06/2011

Description

The requesting company is a subsidiary of a large local communications group and serves as the group's systems house.

In the framework of a year long contract with the national procurement agency responsible for procurement in more than 100 government ministries and entities, they are interested to introduce to them innovative technologies and applications that can bring them real costs savings benefits in the fields of operations, energy efficiency, and connecting to the public.

The offered novel applications should be new to the local market but should have been successfully demonstrated abroad and shown to have brought real benefits to the end users.

Technical Specifications / Specific technical requirements of the request

Possible applications areas may include (but are not limited to):

- Public information and communicating to the general public
- Building/Facility Automation for energy efficiency
- Applications specific to ministries of interior, transportation, infrastructure, health, education
